In severe cases, a rotor bow can produce such high levels of vibration that it becomes impossible to pass through a balance resonance. Thus, prevention of rotor bow is an important part of machinery management. Machinery operation guidelines should be strictly followed, supplemented by a thorough understanding of the physical causes of rotor bow.

The non-moving segment of the machine is known as the stator and the rotating segment is known as the rotor. Rotating machines find a wide variety of uses in a number of domains such as domestic appliances, transportation vehicles and industrial manufacturing plants. AC and DC machines are prominent examples of rotating machines.
